Spectrometer Status

VAC-200 autosampler (Varian Unity)

The magnet will be discharged, possibly even today.

VI-300 (Varian Inova)

The autosampler from the 200 has been installed on this magnet. It is being run in manual mode during the day and automated mode when there are samples from CHEM 2311. Only P31 and H1 nuclei are available until our probes come back from repair. Spectra are saved in the i3data directory.

HD-500 (Bruker Avance III HD)

The Prodigy probe will be sent back to Switzerland on Friday. The instrument will be set up using the BBO probe from the AV-500 until the prodigal probe returns. Expect the instrument to be unavailable all day Friday while the BBO probe is installed and calibrated. We will continue to operate in automation mode.
